

Florentin Smarandache

2,565,000,000,000,000

This is a photoalbum from Greenland. It follows my instant photovideo journal *Noptile Polare Inuite* (Inuit Polar Nights), published by Agora Editions, Romania, 2018.

2,565,000,000,000,000 Tonne Ice Cube sits on top of Greenland, weighting 2.565 quadrillion tonnes, with its mean height of over 2 km, and over 3 km at its thickest point. The global sea levels would raise by 23 feet if the ice of Greenland were to melt.

Enjoy my photographic journey from a place where nobody hear you screaming!
